

P0 Testing

This section describes non-exhaustive testing of P0

1. Create test files:

1. **P0_test1.fs25s1** or containing empty file
2. **P0_test2.fs25s1** containing only

```
ab
```

3. **P0_test3.fs25s1** containing

```
adam 123 adam 35 susan daniel adam 123 35 35 35 35 susan susan adam adam 12 23 x x x x x x y y y  
y y y
```

4. Use additional files, with data over multiple lines, *etc.*
2. For each test file, draw by hand the tree that should be generated. For example, using **P0_test2.fs25s1** should create just one node printing
a: ab
3. Run the invocations and check against predictions
 1. **P0 < P0_test1**
Error message (from the shell, not your program(
 2. **P0 < P0_test1.fs25s1**
Three empty files **out.preorder out.inorder out.postorder** (a message the input is empty is also acceptable)
 3. **P0 P0_test2**
P0_test2.preorder created containing
1: ab
plus 2 other output files containing the same
 4. **P0**
Type on the keyboard
ab Enter ^D
out.preorder created containing
1: ab
plus 2 other files containing the same
 5. **P0 P0_test3**
Creates **P0_test3.inorder P0_test3.preorder P0_test3.postorder**, each containing the proper output
 6. Etc.
